MoRe

Nowadays it is difficult to keep track of the content of many different contracts, both when drafting them and when checking for legal certainty. In particular, the right to one's own data can be violated quickly and easily. With the help of blockchain technology, contractual agreements, including image rights, can be securely and immutable stored and traced. The app MoRe (Model Release) was developed based on this technology. Private photographers in particular will find it easier to work with contracts. In addition to the user interface, the demonstrator also shows the backend with the otherwise hidden blockchain.
